

ENGINEERING TEAM MEETING MINUTES & ARCHITECTURE MEMO

Date: September 4, 2026 | Facilitator: Technical Operations Team

Project Scope and Objectives:

The engineering initiative aims to optimize backend throughput and streamline infrastructure costs.

Key discussion points from the sprint retrospective:

1. Service Resilience: In the event of downstream API latency spikes, microservices must fall back gracefully to cached database read replicas rather than crashing.
2. Memory Footprint: Garbage collection thresholds have been tuned to limit resident memory to 1.5 GB.
3. Security Audit: Periodic vulnerability scanning confirmed zero high or critical CVEs.

Next Steps & Action Items:

- Jordan: Complete Redis cache benchmarking by Friday.
- Maya: Finalize Prometheus metrics dashboard for monitoring.
- Chris: Coordinate cross-region replication testing in staging cluster.
